Semiconductor devices are ubiquitous in modern society, and are relied upon in virtually every electronic device, including most consumer electronics. Along with the development of integrated circuits, manufacturing processes have continued to improve, resulting in smaller and more powerful circuits. There are no limits as to the size of the transistors, and the size of circuits that can be integrated into a semiconductor device have increased to the point of near-theoretical limits. A semiconductor device typically has a die region, a lead region, and a substrate region, with one or more of these regions being an active region of the device. This device also typically has one or more gate structures. In a semiconductor device that has a plurality of gate structures, a first and a second gate structure may be arranged so that they cross one another in such a way so as to form an active region in the device. The term "active region" is a colloquial term that means a region of a semiconductor device that is the source, drain, and/or channel region of one or more transistors. When a semiconductor device is fabricated on a substrate, an insulating layer is typically disposed between the active regions of the semiconductor device and the substrate. In some cases, the insulating layer may be disposed between the first and second gate structures. The insulating layer is typically comprised of silicon oxide. The substrate is typically formed of silicon (Si). However, other materials, such as an epitaxial silicon film, a silicon-on-sapphire (SOS) film, a silicon-on-insulator (SOI) wafer, or a silicon-on-glass (SOG) wafer, can be used. The deposition of an insulating layer may be accomplished using chemical vapor deposition (CVD) or atomic layer deposition (ALD). In the fabrication of semiconductor devices, an application of a voltage to a semiconductor device can be used in a variety of different ways to form a variety of devices. For example, a semiconductor device can be a passive device or an active device. A passive device is a device that is not capable of outputting or receiving electrical signals
